Synthetic Fraud Investigation Playbook

Review workflow for rule and ML anomaly signals

Important: This is a fictional synthetic POC document. It is not official payer policy, medical coding advice, legal guidance, or regulatory guidance.

1. Purpose

A rule or model flag is an investigation signal, not proof of fraud. Reviewers should assess supporting evidence and legitimate explanations.

2. Rule categories

HC-DUP-001: compare member, provider, service date, procedure, units, amount and submission timing.

HC-AMT-001: compare billed amount with procedure reference amounts and peer distributions.

HC-UNIT-001: compare units with synthetic procedure guidelines.

HC-PRV-001: compare provider aggregates with similar specialty/region peers.

HC-TIME-001: calculate submission lag and consider operational explanations.

HC-ML-001: review Isolation Forest anomaly scores with feature context.

3. Review bands

Use the existing Rulebook's initial bands: 70–100 high, 40–69 medium, 0–39 low. These are initial POC assumptions and should be calibrated using controlled tests.

4. Label separation

Do not use synthetic_anomaly_label or synthetic_scenario as model input or during scoring. Join labels only after predictions are produced for evaluation.

5. Outcomes

Record a reviewer outcome, reason, evidence reviewed and follow-up. Do not automatically deny or label a claim as fraudulent solely because a rule or anomaly model flagged it.
