Synthetic Claims Processing Standard Operating Procedure

Illustrative end-to-end claim processing workflow

Important: This is a fictional synthetic POC document. It is not official payer policy, medical coding advice, legal guidance, or regulatory guidance.

1. Intake

Register a unique claim_id and record member, provider, service date, submission date, procedure, units, billed amount and status. Validate required fields and foreign-key relationships.

2. Validation and adjudication

Check coverage dates, procedure references, network information and required documentation. Store the synthetic decision and reason codes as explicit records.

3. Payment and settlement

Record approval and payment events separately. Payment history should include a payment identifier, claim identifier, payment date, amount and status. Avoid inferring settlement dates from the current claim status.

4. Resubmission and audit trail

Represent status changes as timestamped events. Retain earlier events rather than overwriting them. All generated event histories are illustrative synthetic records.

5. Analytics definitions

Claims raised should be counted by submission date. Settled claims should be counted by payment settlement date or an explicit settlement event. Document the chosen metric definition in each chart or SQL answer.
